EXAMINER'S COMMENT

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on February 9, 2004, has been entered.

REASONS FOR ALLOWANCE

2. The following is an examiner's statement of reasons for allowance:

The prior art of record does not disclose or suggest an image side numerical aperture that is greater or equal to 0.75, and a distance D in mm along an optical axis between an optical surface closest to the second object, and the second object, satisfies a condition of $0.1 < D < 5$, and five optical groups having powers (negative, positive, negative, positive, positive), in combination with all the other elements recited in independent claim 1.

The prior art of record does not disclose or suggest an image side numerical aperture that is greater or equal to 0.75, and a distance D in mm along an optical axis between an

optical surface closest to the second object, and the second object, satisfies a condition of $0.1 < D < 5$, and five optical groups having powers (negative, positive, negative, positive, positive), and a flow device between the optical surface closest to the second surface and the substrate, and which forms a predetermined flow of fluid in the optical path between the optical surface closest to the second surface and the photosensitive substrate in combination with all the other elements recited in independent claim 75.

The prior art of record does not disclose or suggest an exposure method wherein the image side numerical aperture that is greater or equal to 0.75, and a distance D in mm along an optical axis between an optical surface closest to the second object, and the second object, satisfies a condition of $0.1 < D < 5$, and five lens groups having powers (negative, positive, negative, positive, positive), and including the step of flow formation of forming a predetermined flow of fluid in an optimal path between the optical surface closest to the second surface and the photosensitive substrate combination with all the other steps recited in independent claim 90.

The prior art of record does not disclose or suggest five lens groups having powers (negative, positive, negative, positive, positive), and wherein the optical path between the fifth lens group and the second surface is filled with a liquid, and wherein a diameter of light beam which passes the projection optical system is a relative maximum in a region between the fourth lens group and the fifth lens groups in combination with all the other elements recited in independent claim 105.
